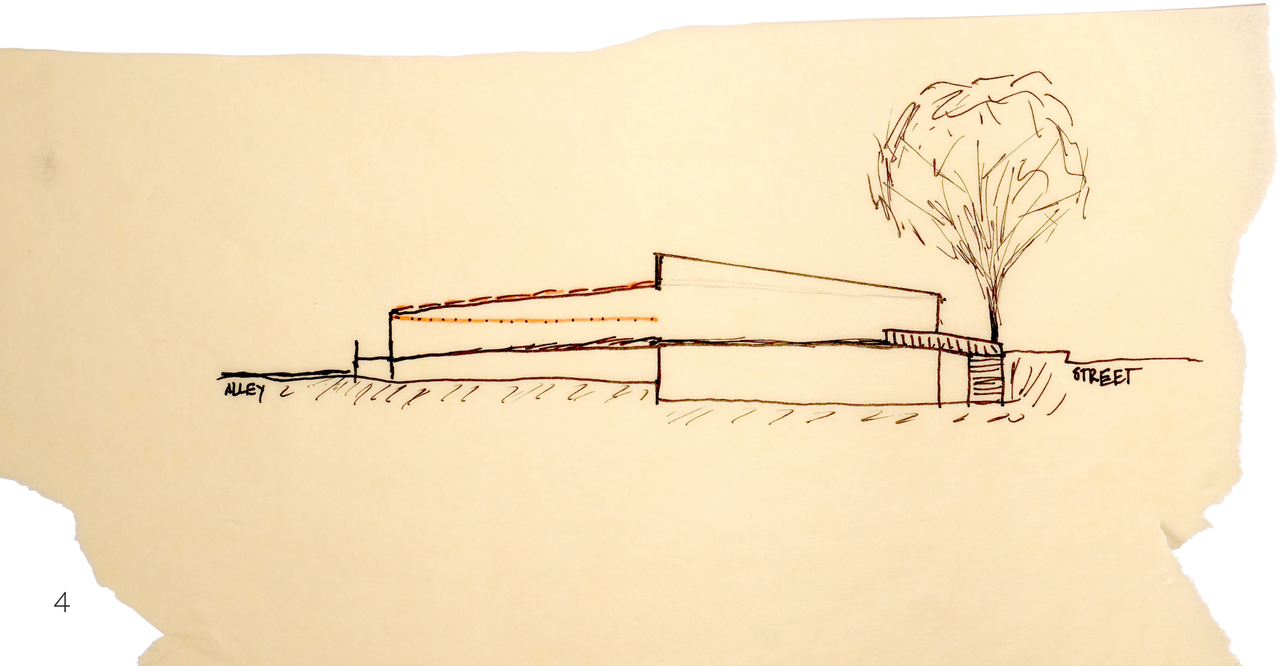
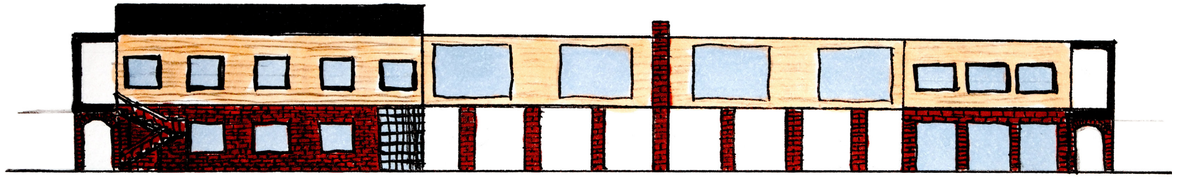
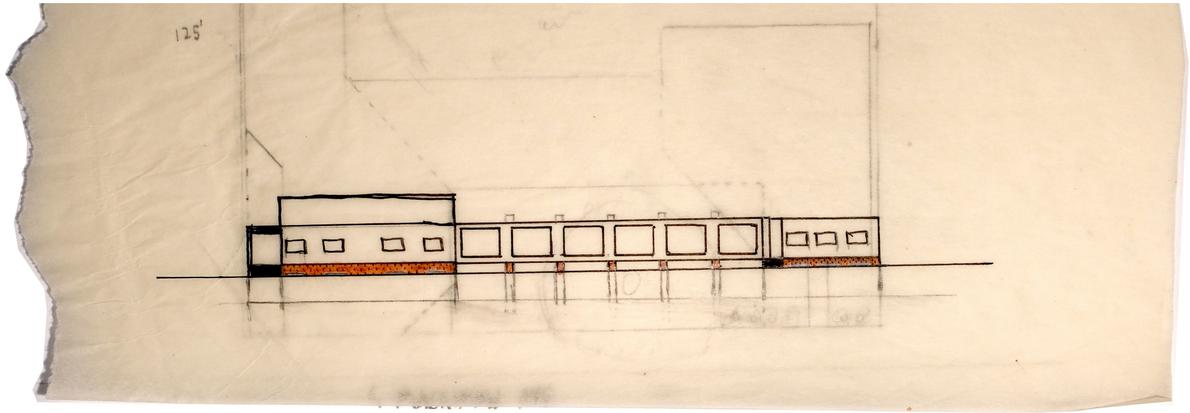
Section R - R'

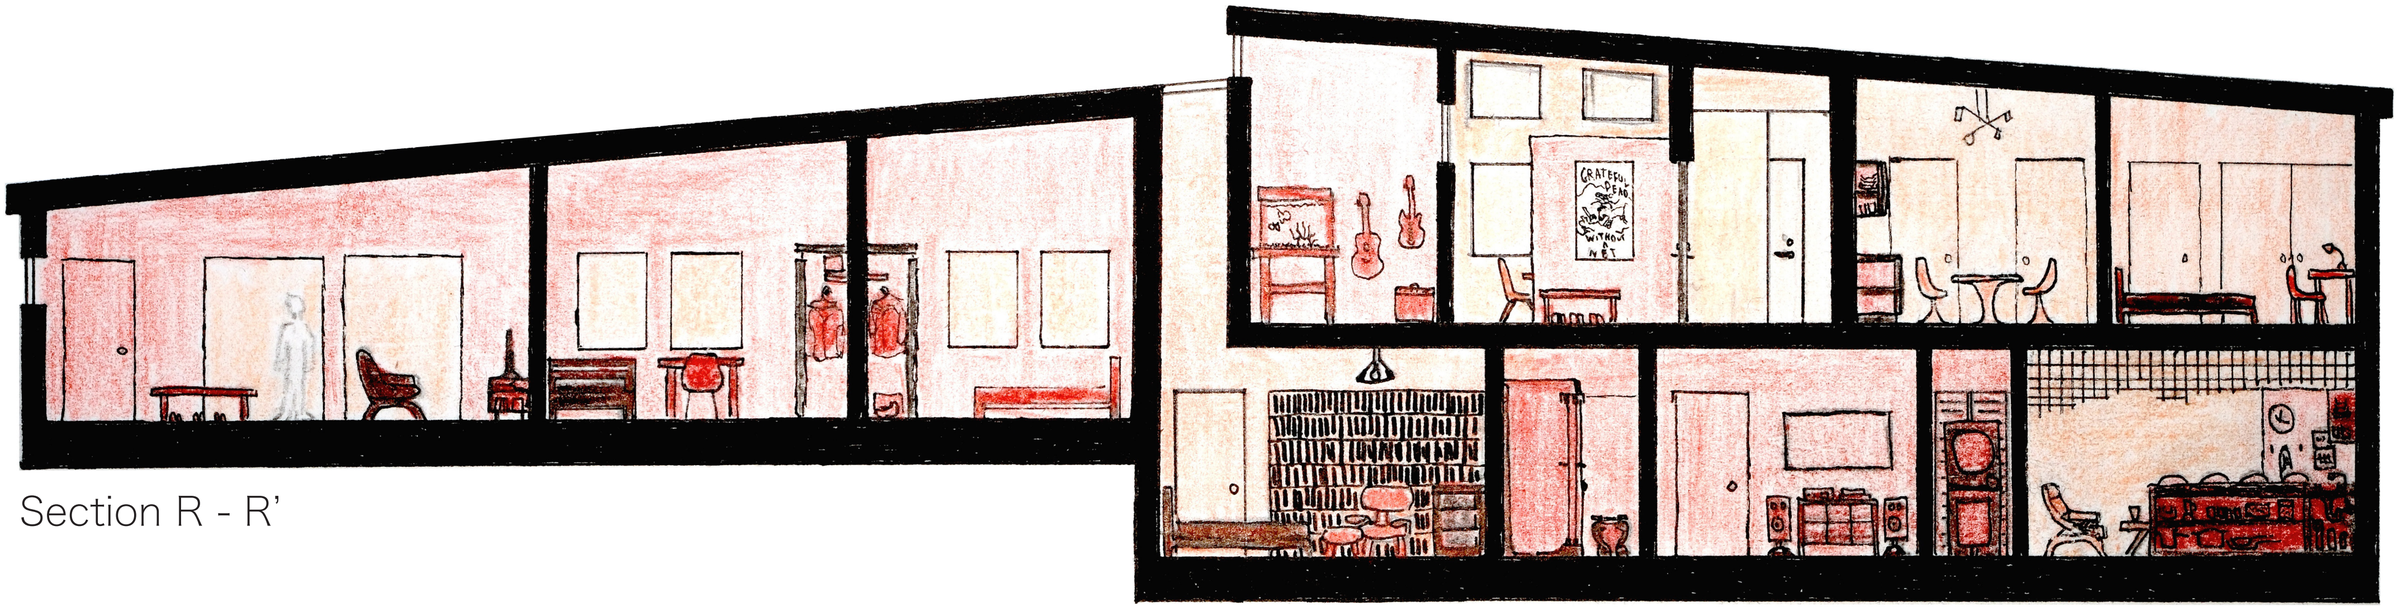




Across from the South Chicago Urban Growers Collective site, my project group designed housing for community members and farmers. We developed an ADA accessible plan on six sunken lots with green roofs and shared spaces. The building preserves existing foliage, utilizes materials from the Chicago architectural vernacular (common brick, wood, and glass brick) and a low profile to appropriately fit our nearly 25,000 square foot site.

Collaborators: Anna Bonnem & Finn Roach



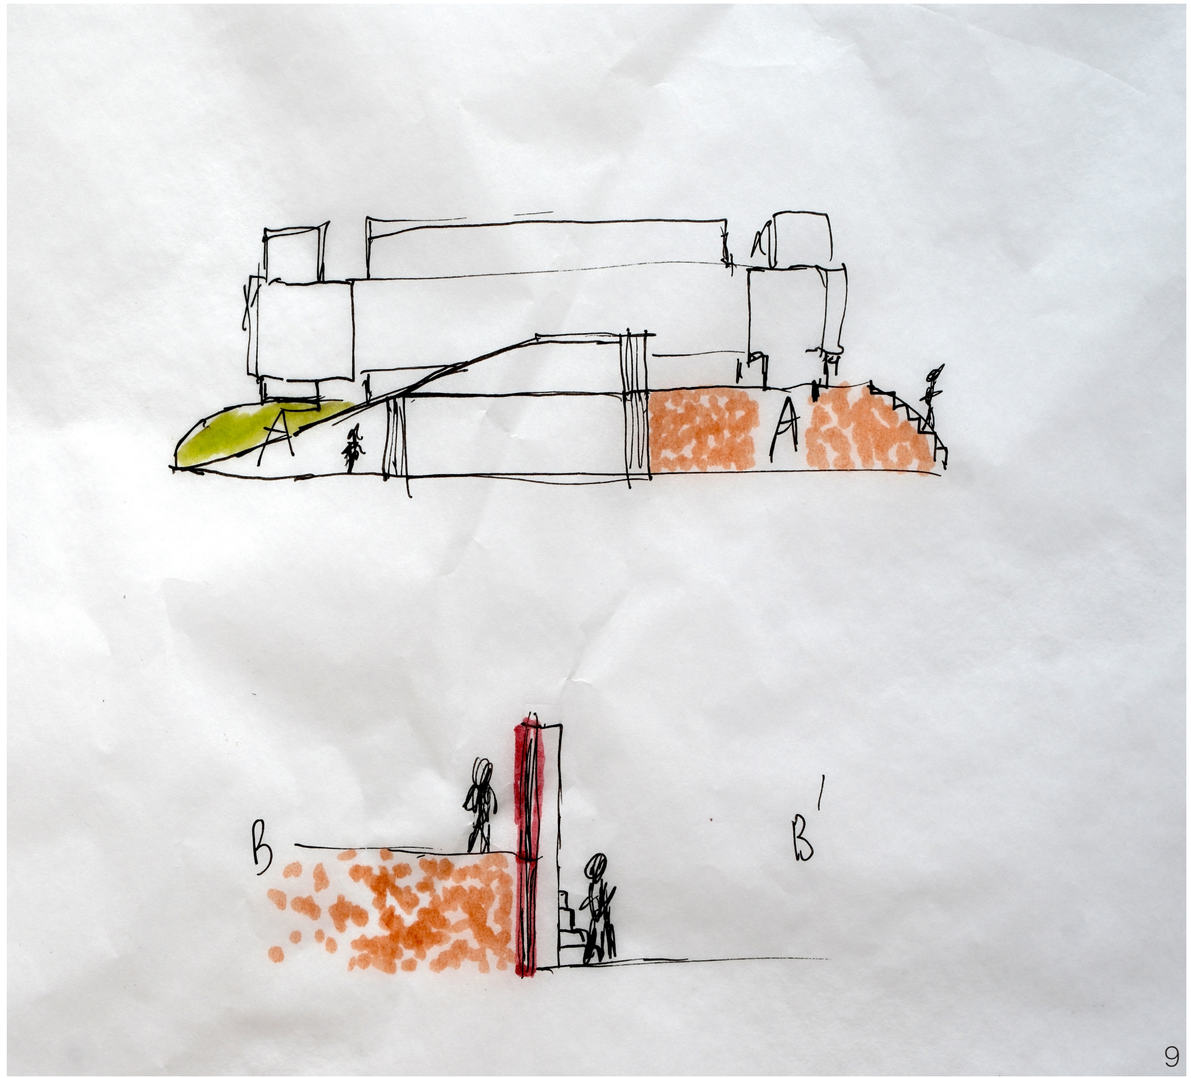


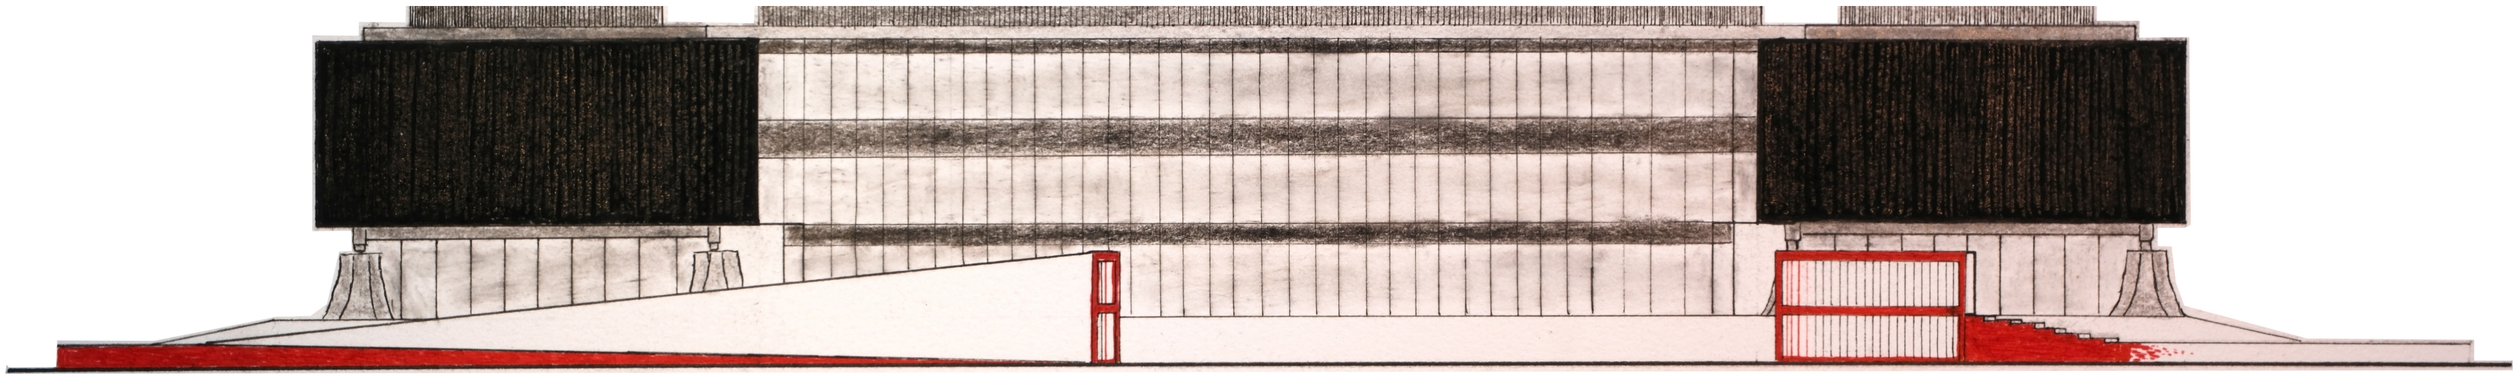
Section R - R’

1111 E. 54TH PLACE

Ascending the ramp to a gently elevated parking lot, the University of Chicago Data Science Center (formerly the McCormick Theological Seminary, built 2003) at 5460 S. University Ave., obscures a peaceful cloister bound by the U-shaped Lutheran School of Theology (1967). This route I walked daily disappointed me with its use of the concrete lot: out of plane with the surrounding streets, and out of touch with the abundance of green space just steps away.

I re-imagined this space without the parking lot or the 5460, as a complement to both the LST courtyard, and nearby Stout Park, across Greenwood Ave. Re-siting and reimagining a musical sculpture I developed for a previous project, the new park gives priority to the neighborhood's ambulatory experience. Considering reverberation and space, I explored the concept of a sonic monument within an interactive public garden.





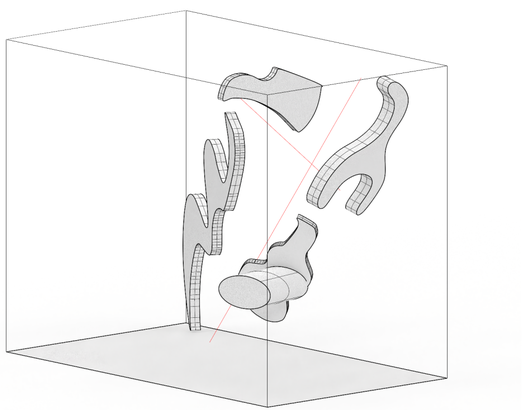
Section A - A’

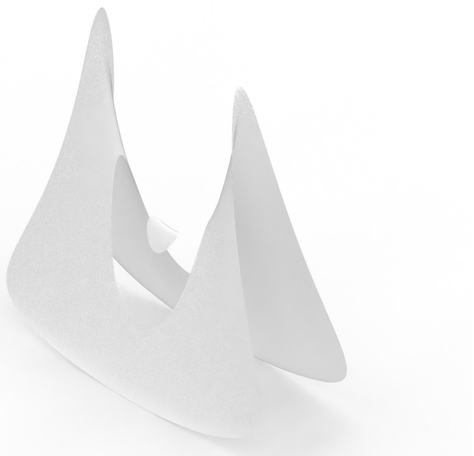
Model portion of the sloped, serpentine musical sculpture.

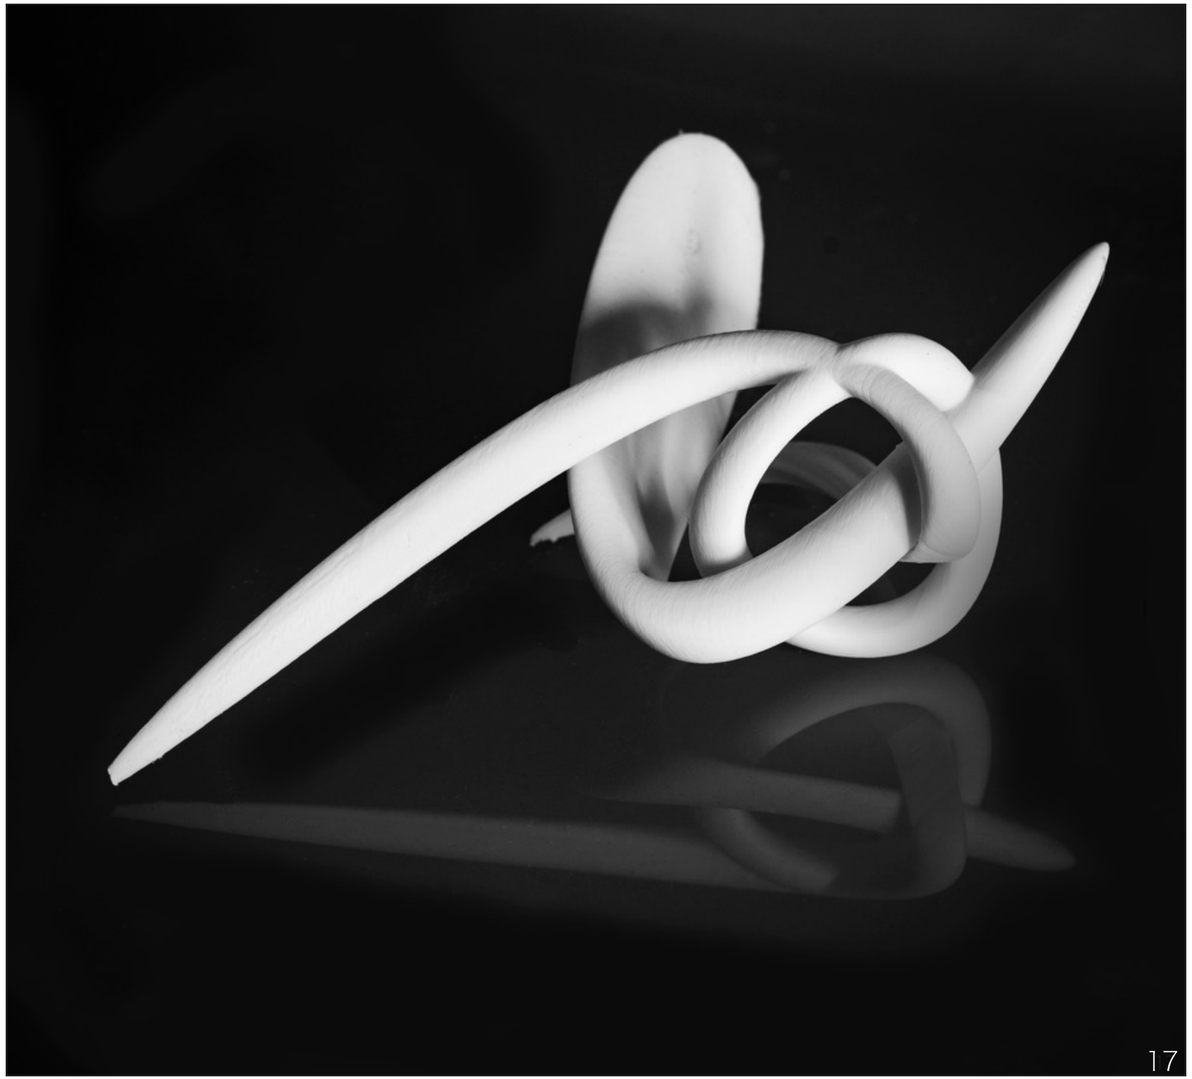
PLASTIC SHAPES

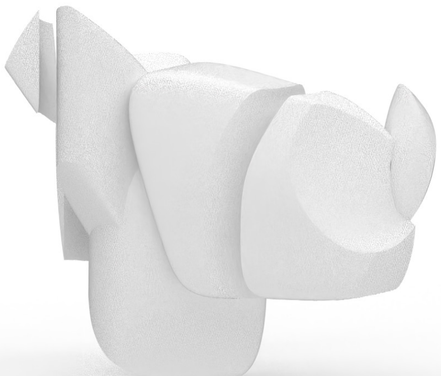
In ***Complex Curves and Plastic Shapes***, I conducted studies of pure form while examining the work of Albers, Gabo, Moholy-Nagy, Arp, Hepworth, Vantongerloo, Bill and Kobro. Form was interrogated through the use of regulating lines, boundary conditions, transparency, and shallow/deep space. The course's focus, the interface between art and architecture, was developed through examinations of 20th century structures that drew from the active, suspended, confounding shapes of Bauhaus and Vkhutemas.

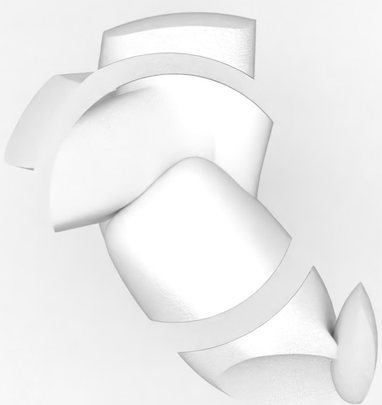
Rhino-based exercises progressed from a line in space, to surfaces, volumes, and finally meshes. Several digital models were prepared for 3D printing and produced.

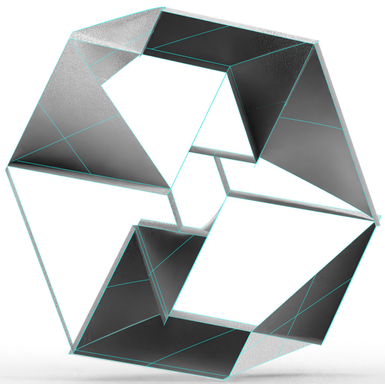


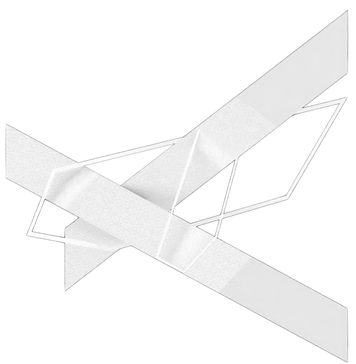












Apt(.) for a friend

Based on his interest in a home workshop, and constrained by an assignment's 500 square foot limit, I designed a functional apartment suitable for Samuel's needs. An open plan multi-use space features a 10 foot workbench, a CNC table, and a wall of storage shelves for projects and tools. The nearby kitchen and dining area are embedded within the workshop. Separated, on the north side of the unit, is a bedroom with ample closet space, and ensuite bathroom with a washer/dryer.

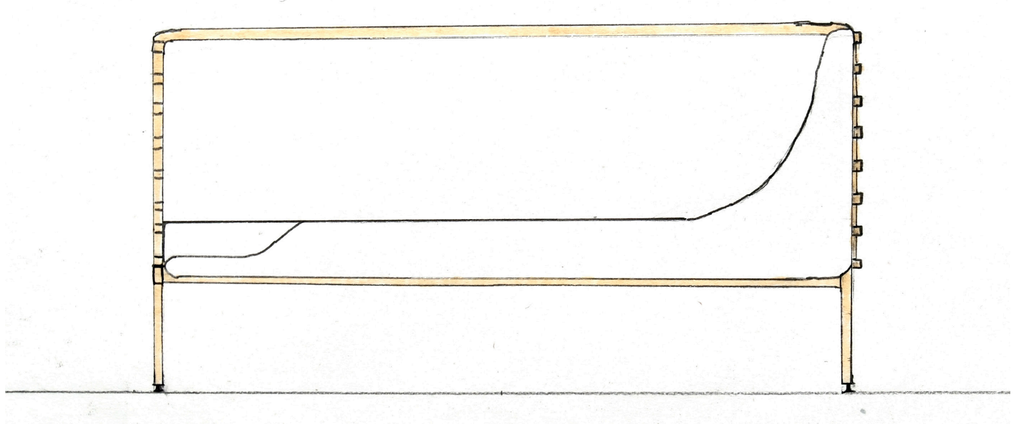
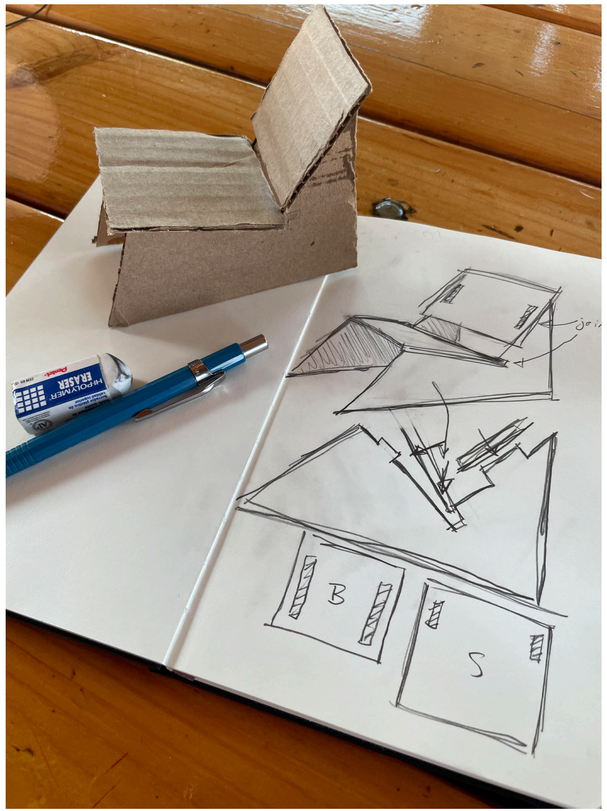
Couch for myself



To (sit on and) play the guitar.

Plywood Furniture Set



Collaborator: Dylan MacIsaac (sketch credit)

For his college house in Virginia, my brother and I collaborated on the design of a flat-packed, hardware-free chair, leg rest, and side table. The set was to be assembled with nothing more than a mallet, and required no glue, screws, or bolts. I constructed the three pieces, and worked with Dylan to refine his vision for the set.
